

## Understanding Quality Standards (QMS)

An **Understanding Quality Standards (QMS)** training program provides employees and leaders with a practical understanding of how quality management systems improve consistency, compliance, and business performance. Designed for organizations implementing or maintaining standards such as **ISO 9001, AS9100, ISO 13485, IATF 16949**, and other industry-specific requirements, this training builds the foundation needed to support an effective quality culture.

Rather than simply reviewing standard clauses, this course explains how quality requirements apply to everyday manufacturing operations. Participants learn the principles of process-based thinking, risk management, document control, corrective action, customer focus, leadership responsibilities, and continual improvement while gaining a clear understanding of how their individual roles contribute to organizational compliance and operational success. The result is a workforce that understands not only what the requirements are, but why they matter.
